                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                 S
                                                                                                                                                                       This is the nucleotide sequence of cDNA encoding the wild-type soybean myo-inositol 1-phosphate synthase (MI 1-PS) present in clone p5bmi-lps (CC (APCC 97970)). The clone was isolated from a cDNA library of soybean line CL (R13 by hybridisation to a probe made from MI 1-PS cDNA of Arabidopsis CC thaliana. MI 1-PS is involved in glucose metabolism to phytic acid, CC raffinose and stachyose. A mutant MI 1-PS mucleic acid (see AAV62443) has been identified in soybean line L133, a mutagenised line of low raffinose accharide phenotype. Sequencing revealed a single base change mutation (G to T at base 1241) in the LR33 sequence. The mutation results in a cc seed phenotype of very low raffinose saccharide sugars, very high sucrose and low phytic acid. The nucleic acid is used to alter the raffinose acc sybean seeds, leading to useful soybean products, e.g. a seed phytic content of less than 17 ug/g, a seed content of raffinose and cc acid content of less than 17 ug/g, as seed sucrose content CC greater than 200 ug/g. (Updated on 17-0CT-2003 to standardise OS field)

The invention relates to a nucleic acid fragment encoding a soybean myo-
cc inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
cc synthase having a decreased capacity for the synthesis of myo-inositol 1-
cc phosphate. The invention also relates to a chimeric gene operably linked
cc to suitable regulatory sequences, where expression of the chimeric gene
cc encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
cc comprising the chimeric gene, a method of making the soybean plant, a
cc seed of the soybean plant, a soy protein product derived from the
cc processing of soybean seeds, a method of making the soybean plant, a
cc seed of the soybean seeds, a method of making or producing a soy
cc protein product and a method of using a sybean plant homozygous for at
cc decreased capacity for the synthesis of myo-inositol 1-phosphate synthase having
cd corporate and methods are useful for producing plants with
cc decreased raffinose, stachyose and phytic acid content and increased
cc soybean products. This sequence represents cDNA encoding a mutant soybean
cc muchal and increased a sucross and increased
cc soybean products. This sequence represents cDNA encoding a mutant soybean
cc muchal and increased a sucross are something a mutant soybean
cc soybean products. This sequence represents cDNA encoding a mutant soybean
                                       myo-inositol 1-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-APR-1997;

Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose phytic acid and inorganic phosphate content of soybean seeds.

Example 8; SEQ ID NO 9; 34pp; English

The invention relates to an isolated nucleic acid fragment encoding a composition of the chimeric gene (compiler synthase having decreasing capacity for the synthase is for myoci institul-1-phosphate. Also included are a chimeric gene (comprising the complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably comprising a sybbean myo-inositol 1-phosphate synthase, its comprising the chimeric gene (content of less than 17 micromol/g, a seed content of raffinose plus content of less than 17 micromol/g, and a seed sucrose content of stachyose of less than 14.5 micromol/g, and a seed sucrose content of comprising the phant, making a soybean plant with the heritable phenotype (comprising crossing LR33) or the plant comprising the chimeric gene content of comprising step that has a heritable phenotype as mentioned above), seeds of soybean plant and selecting a progeny plant of the cross of crossing step that has a heritable phenotype as mentioned above), seeds of soybean plant made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a mithable phenotype as mentioned above), as decreased capacity for the synthasis of myo-inositol 1-phosphate synthase having decreased capacity for heritable phenotype as mentioned above), and making or producing a mentioned above), and making or producing a mentioned above), and making or producing a mithable phenotype as mentioned above).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        soybean protein product derived from seeds of a soybean plant with heritable phenotype as mentioned above. The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean essents leading to valuable and useful soybean products, since the presence of high concentration of raffinose oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a wild-type myonation of the content of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1533 BP; 429 A; 344 C; 368 G; 392 T; 0 U; 0 Other;

CC The invention relates to an isolated nucleic acid fragment encoding a CC shosphate synthase having decreasing capacity for the synthesis for myocomplate synthase having decreasing capacity for the synthesis for myocomplate synthase having decreasing capacity for the synthesis for myocomplate acid encoding soybean myocomplated in the comprising the CC complement, subfragment or the complement of the chimeric gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 14 micromol/g, and a seed content of raffinose plus stacknyose of less than 14 micromol/g, and a seed content of raffinose plus from the plant, making a soybean plant comprising the chimeric gene with comprising crossing LR33 or the plant comprising the chimeric gene with a less than 14 made by the above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a mutant myo-inositol 1-phosphate, where the gene confers a companies of myo-inositol 1-phosphate, where the gene confers a companies of myo-inositol 1-phosphate, where the gene confers a sybean product derived from seeds of a soybean plant with heritable phenotype as mentioned above), and making or producing a subspan plant with heritable phenotype as mentioned above), and making or producing a content of soybean seeds thus leading to valuable and useful conjugate content of soybean seeds thus leading to valuable and useful conjugate content of soybean seeds thus leading to valuable and useful conjugate content of soybean seeds thus leading to valuable and to flatulence when conjugate contents of myo-inositol conductions a will-type myo-in
                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                            This is the nucleotide sequence of cDNA encoding a mutant soybean myo-
CC inositol 1-phosphate synthase (MI 1-PS) present in clone LR33-10. This
CC clone was isolated from a cDNA library of soybean line LR33 by PCR
CC amplification (see AAV62441-42). Line LR33 was obtained by chemical
CC mutagenesis of wild-type soybean genome and as a reduced raffinose
CC sacid, raffinose and stachyose. Sequencing revealed a single base change
CC wild-type sequence (see AAV62440). The mutation results in a seed
CC wild-type sequence (see AAV62440). The mutation results in a seed
CC phenotype of very low raffinose saccharide sugars, very high sucrose and
CC low phytic acid. The mutated MI 1-PS nucleic acid is used to alter the
CC content of soybean seeds, leading to useful soybean products, e.g. a seed
CC phytic acid content of less than 17 ug/g, a seed content of raffinose and
CC stachyose combined of less than 14.5 ug/g, and a seed sucrose content
CC greater than 200 ug/g. (Updated on 17-CCT-2003 to standardise OS field)

results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant comprising the chimeric gene, a method of making the soybean plant comprising the soybean plant, a soy protein product derived from the processing of soybean seeds, a method of making or producing a soy protein product and a method of using a soybean plant homozygous for at least one gene encoding a mutant myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate. The nucleic acid fragment and methods are useful for producing plants with decreased raffinose, stachyose and phytic acid content and increased sucrose and inorganic phosphate content, leading to valuable and useful soybean products. This sequence represents SDNA encoding a mutant soybean inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate synthase having a decreased capacity for the synthesis of myo-inositol 1-phosphate. The invention also relates to a chimeric gene operably linked to suitable regulatory sequences, where expression of the chimeric gene myo-inositol 1-phosphate synthase polypeptide of the invention. The invention relates to a nucleic acid fragment encoding a soybean

Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose phytic acid and inorganic phosphate content of soybean seeds. sucrose,

Claim 8; SEQ ID NO 5; 34pp; English

The invention relates to an isolated nucleic acid fragment encoding a sybbaan myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase having decreasing capacity for the synthases for myo-inositol-1-phosphate. Also included are a chimeric gene (comprising the complement, subfragment or the complement of the synthase, its complement, subfragment or the complement of the subfragment, operably collinked to suitable regulatory sequences, where expression of the chimeric gene results in a decrease in expression of an endogenous or native gene conding a soybean myo-inositol 1-phosphate synthase), a soybean plant comprising the chimeric gene (with a heritable phenotype of a seed phytic comprising the chimeric gene (with a heritable phenotype of a seed phytic caid content of less than 17 micromol/g, as seed content of raffinose plus stachyose of less than 14.5 micromol/g, and a seed sucrose content of crometably comprising crossing LR33 or the plant with the heritable phenotype (comprising crossing LR33) or the plant comprising the chimeric gene with an elite soybean plant and selecting a progeny plant of the cross of crometable phenotype as mentioned above method, a soy protein product derived from seeds of a soybean plant (homozygous for one or more gene encoding a crossing step that has a heritable phenotype as mentioned above, seeds of heritable phenotype as mentioned above. The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a mutant myo-inosphate, sunthase. inositol 1-phosphate synthase

                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a nucleic acid fragment encoding a soybean myo-
CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthesis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC results in a decrease in expression of an endogenous or native gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
CC comprising the chimeric gene, a method of making the soybean plant, a
CC seed of the soybean plant, a soy protein product derived from the
CC processing of soybean seeds, a method of making the producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC cleast one gene encoding a mutant myo-inositol 1-phosphate synthase having
CC decreased capacity for the synthesis of myo-inositol 1-phosphate. The
CC cleic acid fragment and methods are useful for producing plants with
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC soybean products. This sequence represents cDNA encoding a wild type
CC soybean myo-inositol 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                          results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant comprising the chimeric gene, a method of making the soybean plant, a seed of the soybean plant, a soy protein product derived from the processing of soybean seeds, a method of making or producing a soy protein product and a method of using a soybean plant homozygous for at least one gene encoding a mutant myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate. The nucleic acid fragment and methods are useful for producing plants with decreased raffinose, stachyose and phytic acid content and inorganic phosphate content, leading to valuable and useful soybean products. This sequence represents cDNA encoding a mutant soybean myo-inositol 1-phosphate synthase polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate synthase having a decreased capacity for the synthesis of myo-inositol 1 synthase having a decreased capacity for the cynthesis of myo-inositol 1 phosphate. The invention also relates to a chimeric gene operably linked to suitable regulatory sequences, where expression of the chimeric gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid fragment encoding myo-inositol 1-phosphate synthase, useful for producing plants with decreased raffinose, stachyose, and phytic acid and increased sucrose, leading to valuable and useful soy products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (HITZ/)

The invention relates to a nucleic acid fragment encoding a soybean myo-
CC inositol 1-phosphate synthase or a mutant myo-inositol 1-phosphate
CC synthase having a decreased capacity for the synthesis of myo-inositol 1-
CC phosphate. The invention also relates to a chimeric gene operably linked
CC to suitable regulatory sequences, where expression of the chimeric gene
CC results in a decrease in expression of an endogenous or native gene
CC encoding a soybean myo-inositol 1-phosphate synthase, a soybean plant
CC comprising the chimeric gene, a method of making the soybean plant a
CC seed of the soybean plant, a soy protein product derived from the
CC processing of soybean seeds, a method of making the producing a soy
CC protein product and a method of using a soybean plant homozygous for at
CC least one gene encoding a mutant myo-inositol 1-phosphate synthase having
CC decreased capacity for the synthasis of myo-inositol 1-phosphate. The
CC decreased raffinose, stachyose and phytic acid content and increased
CC sucrose and inorganic phosphate content, leading to valuable and useful
CC soybean products. This sequence represents cDNA encoding a mutant soybean
CC myo-inositol 1-phosphate synthase polypeptide of the invention.

cc soybean myo-inositol 1-phosphate synthase, or a mutant myo-inositol 1-phosphate synthase having decreasing capacity for the synthasis for myo-composition of the compression of the chimeric gene (comprising the complement, subfragment or the complement of the subfragment, operably cc linked to suitable regulatory sequences, where expression of the chimeric gene results in a decrease in expression of an endogenous or native gene cencoding a soybean myo-inositol 1-phosphate synthase), a soybean plant cc comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 17 micromol/g, as seed content of raffinose plus trachyose of less than 14.5 micromol/g, and a seed sucrose content of greater than 200 micromol/g, provided that the plant is not LR33), seeds from the plant, making a soybean plant with the heritable phenotype (comprising trossing LR33 or the plant comprising the chimeric gene with the soybean plant and selecting a progeny plant of the cross of consist sep that has a heritable phenotype as mentioned above), seeds of soybean plant made by the above method, a soy protein product derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate content of soybean seeds thus leading to valuable and useful soybean products, since the presence of high concentration of raffinose oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a wild-type myo-
                                       Novel isolated nucleic acid fragment encoding soybean myo-inositol 1-phosphate synthase, useful for altering raffinose saccharide, sucrose phytic acid and inorganic phosphate content of soybean seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           08-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Complement, subfragment or the complement of the subfragment, comprising the complement, subfragment or the complement of the subfragment, operably complement, subfragment or the complement of the subfragment, operably liked to suitable regulatory sequences, where expression of the chimeric gene results in a decrease in expression of an endogenous or native gene encoding a soybean myo-inositol 1-phosphate synthase), a soybean plant comprising the chimeric gene (with a heritable phenotype of a seed phytic acid content of less than 17 micromol/g, a seed content of raffinose plus trathyose of less than 17 micromol/g, and a seed sucrose content of comprising the plant, making a soybean plant with the heritable phenotype (comprising the plant and selecting a progeny plant is not LR33), seeds from the plant making a soybean plant with the heritable phenotype (comprising step that has a heritable phenotype as mentioned above), seeds of soybean plant and selecting a progeny plant of the cross of crossing step that has a heritable phenotype as mentioned above), seeds of soybean plant and selecting a progeny plant of the cross of comprising step that has a heritable phenotype as mentioned above method, a soy protein product derived from seeds of a soybean product derived for the synthese of myo-inositol 1-phosphate synthase having decreased capacity for the synthesis of myo-inositol 1-phosphate, where the gene confers a content of soybean plant of the cross of a soybean plant with heritable phenotype as mentioned above. The nucleic acid is useful for altering raffinose saccharide, sucrose, phytic acid and inorganic phosphate synthase.

Comprision the presence of high concentration of raffinose oligosaccharides in soy plants (and other legumes) can lead to flatulence when consumed by humans. The present sequence encodes a wild-type myo-inosphate synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                    The invention relates to a substantially purified nucleic acid molecule (that encodes a cotton protein or its fragment comprising an EST (expressed sequence tag) appearing as ADP9090-ADP95919. Also included CC are a substantially purified cotton protein or its fragment encoded by a nucleic acid molecule above and a transformed plant (having a nucleic cacid molecule which comprises: an exogenous promoter region which cC functions in a plant cell to cause the production of a mRNA molecule; a structural nucleic acid molecule comprising one of the ESTs or their CC complements; a 3' non-translated sequence that functions in the plant CC ribonucleotides to a 3' end of the mRNA molecule). The ESTs are useful as molecular tool for the targeting and isolation of novel genes for plant CC protection and improvement. The ESTs are useful for developing new continuously, for isolating genes and promoters, for identifying and metabolic pathways, for isolating genes and promoters, for identifying and mapping the genes involved in developmental and metabolic pathways, for isolating genes and promoters, for identifying and mapping the genes involved in developmental and metabolic pathways, and for consider genes in developmental and metabolic pathways, and for its solate genes involved in developmental and metabolic pathways, and for use in marker-assisted breeding programs. The present sequence useful for determining if genes are members of a particular gene family and for use in marker-assisted breeding programs. The present sequence is one of the constant sequence is one of the useful constant genes are useful constant genes are useful constant sequence is one of the constant sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New substantially purified nucleic acid molecule that encodes a cotton protein or its fragment, useful as molecular tool for the targeting and isolation of novel genes for plant protection and improvement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gossypium hirsutum; variety Nucotton33B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immature cotyledons of greenhouse grown plants (individual seed fresh weight of 100-300mg). The library was prepared using the Life Technologies pSuperScript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly(dT) sequence with a NotI restriction site. Sall linkers adapters were ligated to the blunt-ended cDNA fragments followed by NotI digestion. The cDNA fragments were directionally cloned into the NotI-Sall restriction site of the pSPORTI vector. The ligated cDNA fragments were transformed into E. coli ElectroMax DH10B host cells. This library was constructed by Dr. Lila Vodkin and Dr. Anu Khanna. Note that Gm-r1030 is a re-rack of Gm-c1007."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   42.6%;

cDNA library was constructed from weight of 100-300mg). The library
was prepared using the Life Technologies psuperscript cDNA
library construction kit. Complementary DNA was
synthesized from mRNA using a poly(dT) sequence with a
NotI restriction site. SalI linkers adapters were ligated
to the blunt-ended cDNA fragments followed by NotI
digestion. The cDNA fragments were directionally cloned
into the NotI-SalI restriction site of the psporT1
vector. The ligated cDNA fragments were transformed into
E. coli ElectroMax DH10B host cells. This library was
constructed by Dr. Lila Vodkin and Dr. Anu Khanna. Note
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1. .672

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a Not! restriction site. Sall linkers adapters were ligated to the blunt-ended cDNA fragments followed by Not! digestion. The CDNA fragments were directionally cloned into the Not!-Sall restriction site of the pSPORT! vector. The ligated cDNA fragments were transformed into E. coli ElectroMax DH10B host cells. This library was constructed by Dr. Lila Vodkin and Dr. Anu Khanna."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /lab_host="DH10B"

cDNA library was constructed from mRNA isolated from
immature cotyledons of greenhouse grown plants (individual
seed fresh weight of 100-300mg). The library was prepared
using the Life Technologies pSuperScript cDNA library

//Inte="Vector: pT7739ac (Pharmacia); Site_l: ECORI;
//Inte_2: HindIII; This library was constructed from mRNA
isolated from senescing leaf tissue of mature greenhouse
grown plants of the cultivar Williams. Complementary DNA
was synthesized from mRNA using a 3' anchored poly(dT)
primer. EcoRI adapters were ligated to the blunt-ended
cDNA fragments followed by digestion with EcoRI and
HindIII. The cDNA fragments were directionally cloned
into the EcoRI-HindIII restriction site of the pT773-Pac
vector. The ligated cDNA fragments were transformed into
DH10B host cells. This library was constructed by Dr.
Randy Shoemaker."
